Relative effect of COVID on various age groups, and compared to cause of death. These are all relative to COVID, which is 1.0 on each of four charts, USA

Texas and Tri-county comparisons

False Positives Demonstration

Use 0.19% as estimated daily incidence

Prevalence estimated as avg. infected period of 2 weeks X incidence

95% accuracy of test

	Positive	Negative
test pos	2.527%	4.867%
test neg	0.133%	92.473%
	2.660%	97.340%

False pos. is more than half of total positives.

TRUE + 2.527%/7.39%

FALSE + 4.867%/7.39%

Total

0.19% X 14 = 2.660%

Sensitivity	7.39%
Probability of detection where condition exists	92.61%
True + / (True + & False -)	100.00%
95%	
Specificity	34.2%
Probability of not detecting where condition doesn't exist	65.8%
True - / (True - & False +)	100.00%
95%	

Example only; sensitivity and specificity not necessarily equal.

Data in recent weeks are incomplete. Only 60% of death records are submitted to NCHS within 10 days of the date of death, and completeness varies by jurisdiction. Data are not weighted and counts are likely underreported. The previous week's data is shown as dashed, to give an idea of the effect of the gradual update.
