Experimental page: ratios of curve fit deaths to curve fit confirmed cases (CFR)

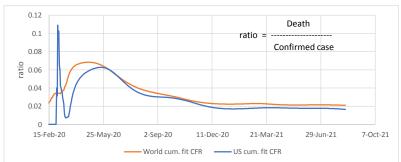

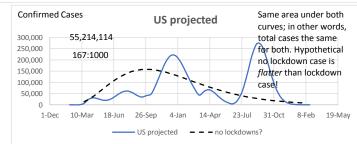

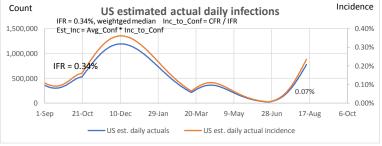

Excess deaths as a Z score:

Baseline set at Z = 0

Above based on Z score of two year standard deviation from 2017-2019. What follows is cumulative plot of same.

False Positives Demonstration

Use 0.07% as estimated daily incidence

Excess normalized to std

dev of 2017 - 2019 deaths.

Prevalence estimated as avg. infected period of 2 weeks X incidence
99% accuracy of test
0.07% X 14 = 0.980%

excess deaths

	Positive	Negative	
test pos	0.970%	0.990%	1.96%
test neg	0.010%	98.030%	98.04%
	0.980%	99.020%	100.00%

False pos. is more than half of total positives.

TRUE + 0.97%/1.96% 49.5% FALSE + 0.99%/1.96% <u>50.5%</u> Total -------- 100.00%

Counter-act this tendency by increasing test sensitivity. However this may increase false negatives, the recipients of which may be positive, think they're negative, and go spread it around some more.
